EDUCATION

Hunter College

B.A. in Computer Science, Minor in Math

New York, NY

Aug. 2025 – Present

- 1 of 41 Computer Science Scholars representing Class of 2029
- Relevant Coursework: Data Structures and Algorithms, Software Analysis and Design, Discrete Structures, Intro to Computer Science

EXPERIENCE

Software Engineer Intern

Mar. 2026 – Sep. 2026

Blitz (Backed by Antler S26)

New York, NY

- Built an internal Automated Code Review CI pipeline which decreased code review times by 2 days by connecting an LLM agent that reviews pull requests as their opened, summarizes them and comments suggested changes.
- Developed a LLM-driven email classification layer that identified 8% more possible brand deals across 70 creators which replaced a deterministic keyword-regex email scorer.
- Created an idempotent database backfill migration that mapped account manager IDs from a legacy free-text field without schema constraints into a normalized schema, backfilling 65 user records across two live databases.
- Led the front-end user interface development during a Next.js 16 migration which reduced bounce rates by 16%.

Software Engineer Intern

Jul. 2024 – Jan. 2025

Unlevered

New York, NY

- Implemented database caching for existing AI-parsed financial summaries which decreased token consumption by 3% the following month and reduced summary fetching from 30s to 200ms.
- Increased AI-summary processing speeds by 60% by decoupling a single prompt workload into 7 parallel chunked LLM calls which streamed the first summary content 15% faster than waiting for the whole summary.
- Improved fetch response time by 42% by implementing server-side pagination for filing search results which shrunk payload sizes by 85% and limited results to 10 per page.
- Eliminated 700ms of fetch latency by implementing client-side caching for already fetched financial data which reduced redundant API calls by 13% across page navigation.

PROJECTS

Syllabus to Calendar | *Next.js, TypeScript, Supabase, LangChain*

- Built a platform used by 40 students which automates manual calendar entry for students by using an LLM to parse uploaded PDF syllabi to generate student deadlines that sync to their Google Calendar.
- Developed an idempotent syllabus upload which hashed new PDF uploads and caching their extracted deadlines, which prevented duplicate syllabi re-calling the LLM for deadline extraction.
- Cut AI parsing costs by 20–30% by preprocessing raw PDF-extracted text (stripping repeated headers/footers/whitespace) before sending it to the LLM, directly reducing input tokens on every uncached request

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, C++, HTML, CSS

Frameworks: React.js, Next.js, Redux, MobX, TailwindCSS, Material UI, Framer Motion, GSAP

Developer Tools: MongoDB, DynamoDB, Firebase, Supabase, RESTful APIs

Libraries: AWS, Azure, Docker, Doppler, GitHub, Figma, Adobe Photoshop
